

## Useful Tips for AdGrip®XL

AdGrip®XL is intended to have the covers retained in the hinge under normal conditions. Slightly filing the corners as shown here, is necessary to allow the covers to clear each other at the corners.

This is a safety feature that minimizes the risk of a cover plate coming loose and possibly causing damage or injury.

However, it may be necessary, for some installations, to be able to remove the covers until the sign face has

been installed. This can be achieved by filing notches at the corners of the base frame as shown below. It is not necessary to notch all the corners. Depending on the access available, only 3 notches should be sufficient.

As a security precaution, it is strongly recommended that small self tapping screws, about 12mm long, be inserted through the hinge of each cover as shown.

This will not detract from the aesthetic appearance of the frame but will deter most vandals.
